

ORDO OS — System Brief (A to Z)

Everything that is on the live website and in the kitchen apps, in one document you can send to anyone.

Brand: ORDO · **Product:** ORDO OS

Restaurants: <https://ordo.asfins.com>

Owner HQ (Super only): <https://control.asfins.com>

WhatsApp: +92 303 9227000

ORDO is a multi-kitchen restaurant operating system: guest QR ordering, counter POS, kitchen tickets, menu, stock, billing, and Android apps. It is not only a POS. Every restaurant is isolated. Super creates kitchens. Each Admin runs only their kitchen. Guests never see Super HQ.

1. Three websites (never mix)

Site	URL	Who	What
Restaurant site	ordo.asfins.com	Guests + kitchen staff	Marketing, guest order, staff login, POS
Super HQ	control.asfins.com	Platform owner only	Create restaurants, billing, upload APKs
API	api.ordo.asfins.com	System	Backend /api
Media	media.ordo.asfins.com	System	Logos, photos, APK files

Rule: Staff/Customer APKs never open Super HQ. Guests never open Admin. Kitchen A data never appears in Kitchen B.

2. Three kinds of people

1. **Super (platform owner)** — create/suspend restaurants, plans, leads, upload Staff + Customer APKs.
2. **Restaurant Admin / Staff** — POS, kitchen, menu, settings for one kitchen code.
3. **Customer / Guest** — menu, cart, order, track — that kitchen only.

Each restaurant has a **code** (example: DEMO). Login and APKs lock to that code.

3. What is written on the public website

Top navigation: Company · Products · Tour · Plans · ORDO OS · Shop · Insights · About

Buttons: Try guest demo · Admin Login · Dark/Light theme

Live Demo Kitchen

- “Try the guest path. No account needed.”
- Dining, pickup, delivery, table QR · code **DEMO**
- Open live demo: /order?tenant=DEMO · scanner: /scan

Product tour (four stations — as written)

1. **Guest** — Scan table QR or Customer APK: menu, modifiers, cart, track status.
2. **Counter POS** — Staff APK / POS bills, prints 58mm, same catalog.
3. **Kitchen** — Tickets placed → preparing → ready. Sound on new guest orders.
4. **Owner** — Sales & Profit, day close, Super HQ billing and named Staff/Customer APKs.

Company copy

“We build the quiet layer between guests and the kitchen.” Hospitality tech with a floor-first story for real service pressure in Pakistan.

- **Practical before complicated** — phones and laptops you already own.
- **Isolated by default** — menu, stock, orders, logo, reviews never cross.
- **Built with local reality** — PKR, mixed dining / takeaway / delivery, WhatsApp, internet required.

ORDO OS modules (as written)

Module	What the website says
Guest order	Public menu, cart, checkout for dining, takeaway, delivery. Track ticket, review after complete.
QR / scanner	Table QR opens the right kitchen and table. Camera or paste / restaurant code.
Staff POS	Counter sale on phone, tablet, or laptop. Same catalog as the public menu.
Kitchen display	One queue for guest and counter tickets. Status moves without a separate app install.
Menu sync	Staff add, hide, or price an item. Guests see that catalog. Cost stays off the public page.
Receipts	58mm browser bill. Thermal hardware is a quoted add-on — not a fake Windows driver.

Connected operations

Order → Prepare → Handoff → Record → Understand

Outcomes (as written)

- **Control** — See what is happening now.

- **Clarity** — Keep every team on the same truth.
- **Continuity** — Carry work into the business record.

Built for Pakistan (as written)

- Use familiar devices — no proprietary POS hardware required.
- Lightweight web operation on everyday networks and screens.
- Local payment reality — cash, wallet, or card recorded after you take the money.
- Isolation you can explain — many kitchens; each keeps its own menu, stock, and logo.

FAQs (as written on the site)

- **What is ORDO?** A restaurant OS: guest ordering, POS, kitchen tickets, menu, stock, Super Admin for many kitchens. POS is one part — not the whole product.
- **Is this only a POS?** No. Guests order from /guest or /scan. Staff run POS, kitchen, menu, settings.
- **Do two restaurants share a menu?** No.
- **How do guests order?** Table QR, restaurant code on /guest, or /order?tenant=CODE.
- **Per-order fee?** No. Monthly PKR. Printers quoted separately.
- **Special POS machine?** No. Browser-first. Internet required.
- **Offline?** No. Live system.
- **JazzCash / card gateway?** Marketing FAQ: paid-in-advance is a recorded status, not a fake checkout SDK. Live Admin Settings can also turn on Bank / JazzCash / EasyPaisa + screenshot proof.

About (as written)

ORDO is the brand. ORDO OS is the live kitchen product. Staff login is on this site. Platform HQ is on control.asfins.com, not in this nav. Isolation: Tenant A never prints Tenant B's name.

Contact

Form fields: name, email, phone, restaurant name, plan, message → Super HQ → Messages.
WhatsApp: **+92 303 9227000**

4. Plans (prices written on the site)

Plan	Price / month	Staff	What the page lists
Starter	Rs999	up to 5	Guest dining / takeaway / delivery, QR, POS + kitchen, menu sync, browser receipts
Pro	Rs1,999	up to 15	Everything in Starter + roles, stock alerts, tracking + reviews, receipt branding
Enterprise	Rs4,499	up to 40	Everything in Pro + Super create/suspend, help into a kitchen, thermal printer package on request, priority onboarding

No per-order fee. Hardware printer quoted separately.

5. Guest / Customer path

Page	Link	What it does
Guest entry	ordo.asfins.com/guest	Restaurant code, Open menu, Gmail, scan QR, paste link
Customer app	/guest?app=customer&tenant=CODE	Welcome to {Restaurant} — that kitchen only
Order	/order?tenant=CODE	Menu, cart, dine-in / pickup / delivery
Table QR	/order?tenant=CODE&table=3	Table number on the ticket
Scanner	/scan	Camera or paste QR
Track	/track/{token}	Status + review after complete

Guest payments in the live app: pay at counter, COD, Bank / JazzCash / EasyPaisa + screenshot (Admin on/off). Special offer popup. Place order.

Customer APK phone name: {Restaurant} Order

Customer never sees: POS, kitchen, thermal print, Super, another kitchen's menu.

6. Staff / Admin path (kitchen)

Login: <https://ordo.asfins.com/login> — restaurant code + username + password (Gmail optional).

Staff APK: /login?app=staff&tenant=CODE

Phone name: {Restaurant} Staff

Top of app: Hello, {username} + restaurant name.

Screen	Path	Job
Home	/home	Hub: POS, Kitchen, Orders, Tables, Thermal, Customer app
POS	/pos	Counter billing, same menu
Orders	/orders	Tickets, print, complete
Kitchen	/kitchen	Tickets, status, order beep
Tables	/tables	Floor / dine-in
Menu	/menu	Items, prices, photos, hide
Staff	/staff	Users, roles, permissions
Day close	/day-close	Shift close
Sales & Profit	/sales	Numbers
Settings	/settings	Name, logo, hours, fees, payments, offers, Your apps, Bluetooth thermal, iPhone install, password

Same Staff APK, different permissions: Admin (Owner) · Cashier · Kitchen.

Staff APK extras: Bluetooth thermal print, new-order beep until Stop, stock-low alert, first-open Hello.

7. Super HQ (control.asfins.com) — not in public nav

Tab	What it does
Home	How it works: add restaurant, they login on ordo.asfins.com, guests use /order?tenant=CODE, upload APKs
Your restaurants	Add restaurant + Admin (code, name, plan, username, password, email). Pause, renew, past due, Passwords & Gmail, Open Admin (Help)
Apps	Upload Staff .apk and Customer .apk per kitchen (Play Store: .aab)
Pricing plans	Starter / Pro / Enterprise
Messages	Leads from the public contact form
Settings	Platform Super settings

Help mode: Super opens a kitchen with a yellow “Help mode · Super” banner. That is not the kitchen’s Admin login.

8. Two Android apps

App	Who	Opens	Thermal
Staff	Admin, cashier, kitchen	/login?app=staff&tenant=CODE	Yes (Bluetooth)
Customer	Diners	/guest?app=customer&tenant=CODE	No

Admin downloads from Settings → Your apps (own kitchen only). Super uploads under Apps. iPhone: web / Add to Home Screen (not an IPA WhatsApp sideload).

New restaurant: (1) Super adds restaurant + Admin (2) Super uploads Staff + Customer APKs (3) Admin sends Customer APK to guests, Staff APK to team. In-app name follows Settings immediately. Phone home-screen name needs a branded APK upload.

9. Kitchens on the live site today

Code	Name	Role
DEMO	Demo Restaurant	Public demo kitchen
ISO2	Iso Kitchen Two	Second test kitchen (proves isolation — not a client brand)

A real client kitchen is created in Super with its own code (example: LAHORE1).

Demo staff login (also printed on the login page): code DEMO · admin / admin123. Change passwords in production.

10. Order flow (A to Z)

1. Guest opens QR / code / Customer APK.
2. Cart → Place order (dine-in / pickup / delivery + payment).
3. Ticket appears on that kitchen's Orders + Kitchen.
4. Staff hear alert until Stop.
5. Ready → guest track page.
6. Complete → review + stock.
7. Print from POS/Orders → Bluetooth thermal in Staff APK, otherwise browser 58mm.

11. Isolation (say this when you brief someone)

- Each kitchen: own menu, stock, orders, logo, staff, reviews.
- APKs bake tenant=CODE.
- Admin API never serves another kitchen's APK.
- Tenant A's receipt never prints Tenant B's name.

12. Technology (for a developer)

Next.js + TypeScript · Vercel · MongoDB Atlas · Cloudflare R2 · Resend · WhatsApp leads.

13. One-sentence pitch (copy this)

ORDO is a multi-kitchen restaurant OS: public guest ordering plus staff POS, kitchen, and print. Super HQ creates isolated kitchens and branded APKs. Staff APK = billing, kitchen, thermal. Customer APK = that kitchen's orders only. Data never mixes.

ORDO · ordo.asfins.com · control.asfins.com · +92 303 9227000 · Copy-paste version: docs/ORDO-SYSTEM-BRIEF.md in the project.
